

Create an SFTP export integration

02/24/2026 2:13 pm EST

Bluecore can connect to any SFTP that uses a host, username, and password for authentication in its SFTP integration, including Files.com, Salesforce Marketing Cloud (SFMC) or Snowflake.

This integration allows you to export email service provider (ESP) or eligibility information.

User Role	View	Edit
Client Admin	Yes	Yes
Data Manager	Yes	Yes
Viewer	Yes	No

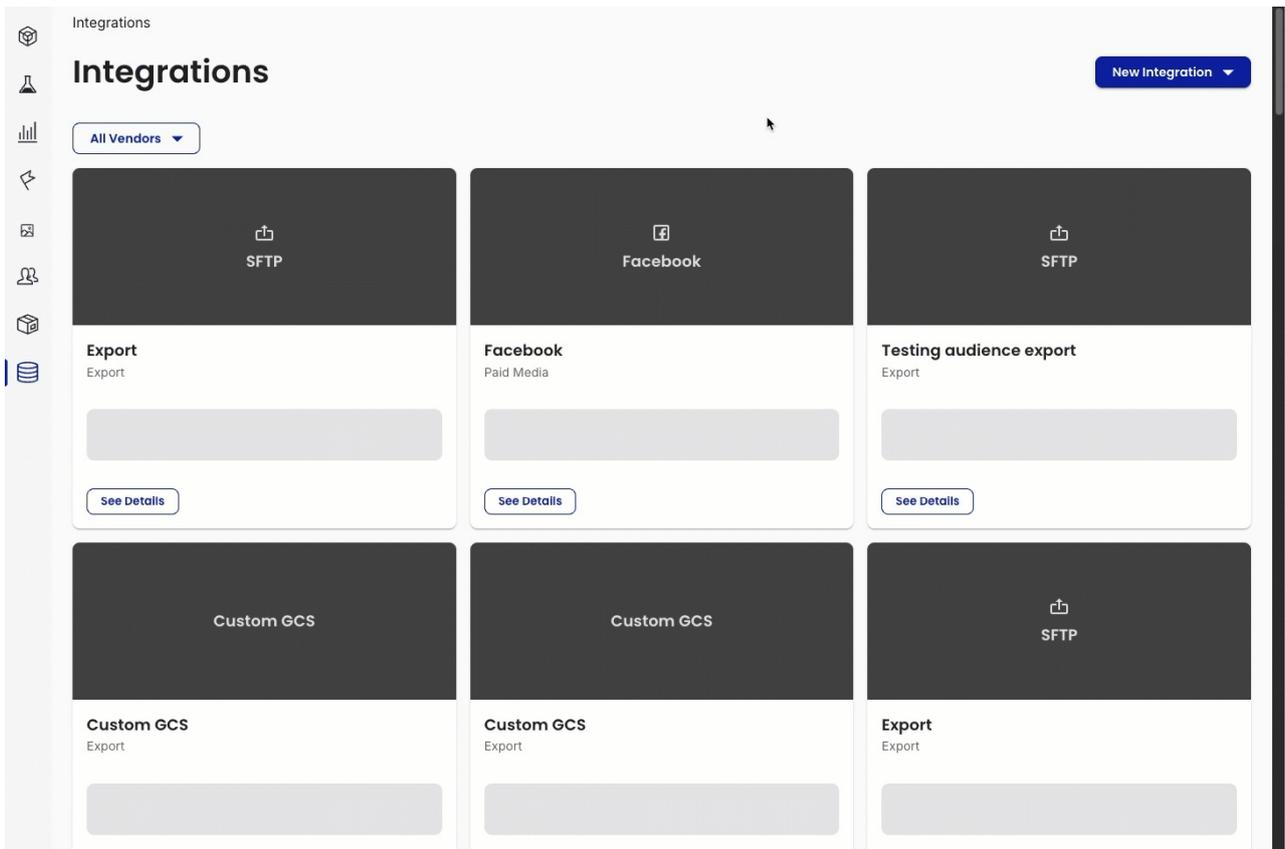

SFTP integrations can be used for any export type, and this article focuses on event exports. To create an SFTP integration for audience or customer exports, see [Create an SFTP audience or customer export integration](#).

Prerequisites

- An SFTP account.
- Service-level credentials to the SFTP account.
- Your SSH private key, if you want to use SSH key authentication. It must be Base64-encoded and can be entered in the **Password** field.

Create an SFTP export integration

1. Navigate to **Data Management** > **Integrations**. The Integrations list appears.
2. Click **New Integration** > **Export to secure SFTP**.
3. Complete the **Settings**, **Authentication**, and **Campaign** tabs and click **Save**.

Export to Bluecore's Files.com instance

To export the file to Bluecore's Files.com instance, enter the directory path where the file should go, including the Namespace name.

Example: `Namespace/exports/audience_exports`

To export the file to a non-Bluecore hosted file share, enter the directory path.

Example: `/exports/audience_exports`
